

Baby's First Teeth - Tooth Eruption Patterns

Usually the first baby teeth to come into the mouth are the two bottom front teeth. They begin to appear when your child is about 6 to 8 months old. They are followed by the 4 upper front teeth. The remainder of your baby's teeth will appear periodically, usually in pairs on each side of the jaw, until the child is about 2 1/2 years old.

By the time your child is 2 1/2 years old, all 20 baby teeth will most likely have come in. When the child is 5 to 6 years of age, his/her first permanent teeth will begin to erupt. Some of the permanent teeth replace baby teeth, others don't.

The following picture shows approximately when each baby tooth should erupt. Do not worry if some teeth are a few months early or late. Every child is different.

Even though baby teeth will eventually be lost, they are just as important as the adult teeth. They not only hold the space for incoming permanent teeth, but are also important for biting and chewing food, speech, and physical appearance. Early tooth loss due to dental decay can have a serious impact on your child's self-esteem and self-confidence in their appearance.

For this reason, it is important to teach your child from an early age, the importance of eating a healthy diet, and practicing daily oral hygiene to maintain healthy teeth and gums for a lifetime of smiles.
